CLAIMS

5

30

- 1. A fluid dispenser device, comprising:
- a chamber (15, 15') provided with an inlet valve (2, 112) and with an outlet valve (67, 76), and defining a sealed slide cylinder (14);
- a piston (6) disposed inside the chamber and including a lip (61) capable of sliding in sealed manner in said slide cylinder (14);
- an actuator rod (7) on which the piston (6) is 10 slidably mounted;
 - a bearing flange (42) for coming to bear against a reservoir neck; and
 - a ferrule (5) against which the piston (6) is resiliently urged in the rest position;
- said device being characterized in that the sealed slide cylinder (14) is situated above the bearing flange (42), so that it cannot be inserted into a reservoir neck.
- 2. A fluid dispenser device according to claim 1, in which the slide cylinder (14) defines a bottom abutment end (13) situated substantially at the bearing flange.
- 3. A fluid dispenser device according to claim 1 or claim 2, in which the piston (6) is provided with guide means (63, 65) for holding it on the axis inside the chamber.
 - 4. A fluid dispenser device according to claim 3, in which the guide means include a top guide sleeve (65) engaged in a through hole formed by the ferrule (5).
 - 5. A fluid dispenser device according to any preceding claim, in which said rod is not in contact with the ferrule.
- 35 6. A fluid dispenser device according to claim 4, in which the top sleeve (65) surrounds the actuator rod (7).

7. A fluid dispenser device according to claim 3 or claim 4, in which the guide means include a bottom guide sleeve (63) engaged in a bushing (3) defining a bottom portion (15') of the chamber.

5

8. A fluid dispenser device according to claim 7, in which the bushing (3) defines a bottom end (32) serving as an abutment for the inlet valve (2) in the open position.

- 9. A fluid dispenser device according to claim 5, in which a precompression spring (82), situated outside the chamber, bears between the rod (7) and the piston (6) so as to urge the outlet valve (67, 76) into the closed position.
- 10. A fluid dispenser device according to claim 5, in which a return spring (81), situated outside the chamber, bears between the rod (7) and the ferrule (5) so as to urge the piston (6) into the rest position.
- 11. A fluid dispenser device according to any preceding claim, in which the slide cylinder (14) is formed by a body, the bearing flange (42) being formed by a ring (4) engaged around the body (1).
- 12. A fluid dispenser device according to any preceding claim, in which the chamber defines a top portion (15) situated above the bearing flange, and a bottom portion (15') situated below the flange, the slide cylinder (14) being situated at the top portion (15).
- 13. A fluid dispenser device according to any preceding claim, including a pushbutton (9) forming a fastener sleeve (92), the actuator rod (7) defining a housing (749), the sleeve being engaged in the housing.

14. A fluid dispenser device according to any preceding claim, including a vent passage (154) that is closed in the rest position by a cone-shaped sealing contact.
